

FOUNDATION OF ENTERPRISE RESOURCE PLANNING SYSTEM

Business benefits only get better as additional business processes are integrated into the system. The Auspac Distribution system serves as the foundation of your total integrated solution

At the center of every successful business is the software system used to process information. We provide integrated business solutions to help you maximize efficiency. With Auspac Distribution System, companies can save both time and money through more efficient automation management system. Complete historical information about the goods and materials movement is maintained to facilitate the distribution practices. Our distribution system makes it easier for you to do business with your customers, vendors and partners.

Bill of Materials (BOM)

BOM is used extensively in the manufacturing and distribution process, to assist with material requirements, and to detail the exact formula or recipe for the finished goods.

Electronic Data Interface (EDI)

With this module, basic sales transactions in supply chain activities can be replaced by electronic communication. It provides a bridge between two different software systems.

Barcode/Labels Generator

Bar coding not only improves the speed of basic warehousing operations by improving efficiency and inventory management, but it also ensures accuracy during shipping operations.

Quotation/Contact Management

This module generates basic quotes using standard pricing and part numbers. It then quickly convert entire quotes or individual quote lines to Sales Orders automatically. This offers faster turn around and a better overall customer experience.

Technical Service/Maintenance

With this module, any product complaints and service calls can be tracked. All service details are recorded to include call status, problem symptoms, site visits categories, warranty types, technician paying the visits and employee handling the complaints.

Sales Management

A Sales Management module enables you to focus on your customers' needs and effectively manage all aspects of the sales cycle. It contains all the functions required to place and track sales orders. When a customer calls, you'll know the availability of specific item in inventory, customer credit limits, item pricing and much more. The user just needs to enter the order once and all sales information can be recalled later for completing the shipment and invoicing.

Inventory Management

Inventory Module keeps track of stock levels, stock valuation, and stock activities. It enables you to quickly view inventory levels for multiple locations throughout your enterprise. It automates the processes for inventory management, all necessary documentation, and real-time inventory updates. It provides customers an immediate response on product availability.

Purchasing Management

The Purchasing Module with add-on Purchase Requisition function provides complete controls of procurement process, from internal Purchase Request to Purchase Order through goods receiving, back order tracking and posting to Accounts Payable. The fully integrated module enables companies to centrally manage all of their purchasing processes using a single platform.
