Automatic data collection system

Bar code application for warehouse and distribution sets the tone for how quickly a company can run their operations. Bar coding not only improves the speed of basic warehousing operations by improving efficiency and inventory management, but it also ensures accuracy during picking and shipping operations either on site or off at customer sites.

Automatic identification eliminates human error and reduce time and labor by replacing manual methods of data entry and data collection. Once bar-coded data is collected via a bar code scanner, activity can be tracked efficiently and accurately at speeds not possible using manual data entry and reading systems.

Automated data collection is seen as the key to improving control and providing management with more timely, more accurate and therefore more valuable information. Increased productivity and reduced costs are the key benefits of automated data collection.

The following are just a few of the many ways bar codes are being used in Auspac Business Software to improve the profitability and efficiency:

- Point of Sales
- Work in Progress and Production Monitoring System
- Secured access, Time and Attendance
- Fixed Assets Management
- Inventory and Quality Control
